UTILITY

as-built surveys

During construction, unexpected challenges such as unforeseen site conditions or limited material availability can lead to design changes in the field. It is important to capture these changes, particularly in the case of underground utilities, otherwise it can be difficult to locate structures for maintenance or repair or to avoid utility conflicts in the event of future development.

WithersRavenel's multiple teams of conventional land surveyors perform accurate utility as-built surveys for all water, sewer, and stormwater features, including inverts. These surveys provide developers with peace of mind that critical utility location information has been thoroughly and reliably recorded.
